

last week:

create user stories

assign stories to group members

change “functionality” to “API/DB implementation”

- might break this up more later??

create more visualization stories to assign to ourselves?? for some reason?

this week:

everyone posts a small submission to GitHub to start, including basic file structure and some other useful files

Langston

- wireframes for all pages, general layout and interaction between all pages decided (possibly begin implementation)

Ashley

- finalize database schema, consider user login and identification information, implement?
- brainstorm relationships between zodiac signs and genres, songs, artists etc.

Jasper

- begin working on API integration and endpoints, implement JS for login page?

Ben

- implementation for about page (detailed text not necessary now, just focus on layout)

Lachlan

-

Unassigned:

- create directory structure (should not be too complicated)

roadmap:

- figure out how we want to lay out website, discuss design plans
- interact with web service and database in order to gather data needed from users, build layout of website separately
- implement HTML, CSS, handlebars and JS to create functional parts of website, everything will be built to work together
